SUMMARY

Full stack engineer with 5+ years building and operating production systems in integration-heavy e-commerce. TypeScript across React/Next.js and Node.js/NestJS, plus PostgreSQL, Redis, REST APIs, data transformation, and third-party integrations. Own work from solution design through deployment: event-driven queues, retries, fault tolerance, Docker, Kubernetes, and production debugging with partners and external systems. Comfortable adding LLM/AI automation where it reduces operational work.

SKILLS

Frontend: TypeScript, React, Next.js, Vue, Nuxt, Angular, JavaScript

Backend & integrations: Node.js, NestJS, REST APIs, GraphQL, third-party integrations, data transformation, data synchronization, error handling

Data: PostgreSQL, MySQL, Redis, Elasticsearch, OpenSearch **Event-driven:** RabbitMQ, queues, messaging, asynchronous workflows, retries, fault tolerance

Infrastructure: Docker, Kubernetes, AWS (EKS, Lambda, EC2, ALB, VPC, RDS, S3), Terraform, GitLab CI/CD, cloud-based deployment

AI (projects): OpenAI, Anthropic, LLMs, AI agents, RAG, vector search, AI automation **Reliability:** production debugging, observability, Sentry, monitoring, architecture, code reviews, testing

PROFESSIONAL EXPERIENCE

Skillnet Solutions, USA — Senior Full Stack Engineer

Jan 2023 – Present

- Own full stack production applications for a retail e-commerce / marketplace platform (Wilco): NestJS/Node.js APIs, Vue/Nuxt and Angular UIs, GitLab CI/CD to AWS. Take integrations from design to deployment to production without a dedicated ops team.
- Build and maintain third-party integrations for inventory-style search and distribution: Elasticsearch/OpenSearch APIs, Enterprise Search, and Epicor item numbers so store search returns the correct SKU instead of empty results.
- Design REST API integrations with retries, backoff, error handling, and data transformation (typed filters, schema alignment) after schema drift caused 400s on every string filter.
- Operate event-driven workflows with RabbitMQ plus PostgreSQL/MySQL (Aurora/RDS) and Redis; Knex migrations and production-safe schema changes for data synchronization across services.
- Recover production integration failures (circuit-breaker 500s, empty kiosk results), monitor search cluster health on Kubernetes, and debug across APIs, databases, and partner item-code systems.
- Cut kiosk search latency from ~5s to ~1.5s; deploy and improve Docker/Kubernetes (EKS) and Terraform (VPC, ALB, RDS, S3, Lambda). Architecture, testing, and code reviews.

Maharshi Tech Solutions — Software Engineer

Jan 2022 – Dec 2022

- Built TypeScript/Node.js services and async processing pipelines with retries, error handling, and fault tolerance for unreliable downstreams.
- Worked directly with product and platform partners on API contracts; troubleshoot integration issues through to production-ready changes.
- Added monitoring, structured logging, and production debugging; contributed to Docker and CI/CD cloud-based deploys.

DMI, India — Software Engineer

Jan 2021 – Dec 2021

- Built backend services and data synchronization pipelines for high-volume systems with an emphasis on performance and fault tolerance.
- Designed asynchronous workflows with retries and consistent error handling; improved observability via logging, monitoring, and performance tuning.

PROJECTS

Bridgeflow — Next.js, TypeScript: e-commerce migrations and integrations; Next.js frontend, data transformation, and sync for products, orders, and customers.

Personal Assistant Agent — LangGraph, OpenAI, Anthropic, RAG: tool use, memory, RAG over notes/docs with Pinecone and PG Vector (vector search).

Calling Agents / SRE Ops Agent — LLMs: multi-step agents with tool use, WebSockets/SSE streaming (Node.js and Python), recovery-oriented ops workflows.

CERTIFICATIONS

GraphQL Full Stack Development — Coursera | VTEX IO Advanced Developer Training — VTEX Certifications
